

NRG: Mac & FileMaker Shipping Software

How can I change the UPS label output type when using FileMaker Pro?

While preferences allow you to easily select the label output type, you may want to create some labels that are printed to laser, and others that are printed to a thermal printer.

When integrated with your FileMaker Pro database, you can override the default output method by simply setting the LabelType field in the Ship table prior to running the ship process to one of the following values:

Laser

Thermal

Thermal DocTab

Note that once a label is created, you cannot simply change the value of LabelType to another value for alternate output. You must run the void process and re-ship.
